

High efficiency 48-MHz Arm® Cortex®-M4 core, 256-KB code flash memory, 32-KB SRAM, Segment LCD Controller, Capacitive Touch Sensing Unit, USB 2.0 Full-Speed Module, 14-bit A/D Converter, 12-bit D/A Converter, security and safety features

Features

■ Arm Cortex-M4 Core with Floating Point Unit (FPU)

- Armv7E-M architecture with DSP instruction set
- Maximum operating frequency: 48 MHz
- Support for 4-GB address space
- Arm Memory Protection Unit (Arm MPU) with 8 regions
- Debug and Trace: ITM, DWT, FPB, TPIU, ETB
- CoreSight™ Debug Port: JTAG-DP and SW-DP

■ Memory

- 256-KB code flash memory
- 8-KB data flash memory (100,000 program/erase (P/E) cycles)
- 32-KB SRAM
- Flash Cache (FCACHE)
- Memory Protection Unit (MPU)
- 128-bit unique ID

■ Connectivity

- USB 2.0 Full-Speed Module (USBFS)
 - On-chip transceiver with voltage regulator
 - Compliant with USB Battery Charging Specification 1.2
- Serial Communications Interface (SCI) × 4
 - UART
 - Simple IIC
 - Simple SPI
- Serial Peripheral Interface (SPI) × 2
- I²C bus interface (IIC) × 2
- Controller Area Network (CAN) module
- Serial Sound Interface Enhanced (SSIE)

■ Analog

- 14-bit A/D Converter (ADC14)
- 12-bit D/A Converter (DAC12)
- 8-bit D/A Converter (DAC8) × 2 (for ACMPPLP)
- Low-Power Analog Comparator (ACMPPLP) × 2
- Operational Amplifier (OPAMP) × 4
- Temperature Sensor (TSN)

■ Timers

- General PWM Timer 32-Bit (GPT32) × 2
- General PWM Timer 16-Bit (GPT16) × 6
- Low Power Asynchronous General-Purpose Timer (AGT) × 2
- Watchdog Timer (WDT)

■ Safety

- Error Correction Code (ECC) in SRAM
- SRAM parity error check
- Flash area protection
- ADC self-diagnosis function
- Clock Frequency Accuracy Measurement Circuit (CAC)
- Cyclic Redundancy Check (CRC) calculator
- Data Operation Circuit (DOC)
- Port Output Enable for GPT (POEG)
- Independent Watchdog Timer (IWDG)
- GPIO readback level detection
- Register write protection
- Main oscillator stop detection
- Illegal memory access

■ System and Power Management

- Low power modes
- Realtime Clock (RTC) with calendar and Battery Backup support
- Event Link Controller (ELC)
- DMA Controller (DMAC) × 4
- Data Transfer Controller (DTC)
- Key Interrupt Function (KINT)
- Power-on reset
- Low Voltage Detection (LVD) with voltage settings

■ Security and Encryption

- AES128/256
- GHASH
- True Random Number Generator (TRNG)

■ Human Machine Interface (HMI)

- Segment LCD Controller (SLCDC)
 - Up to 38 segments × 4 commons
 - Up to 34 segments × 8 commons
- Capacitive Touch Sensing Unit (CTSU)

■ Multiple Clock Sources

- Main clock oscillator (MOSC)
 - (1 to 20 MHz when VCC = 2.4 to 5.5 V)
 - (1 to 8 MHz when VCC = 1.8 to 2.4 V)
 - (1 to 4 MHz when VCC = 1.6 to 1.8 V)
- Sub-clock oscillator (SOSC) (32.768 kHz)
- High-speed on-chip oscillator (HOCO)
 - (24, 32, 48, 64 MHz when VCC = 2.4 to 5.5 V)
 - (24, 32, 48 MHz when VCC = 1.8 to 5.5 V)
 - (24, 32 MHz when VCC = 1.6 to 5.5 V)
- Middle-speed on-chip oscillator (MOCO) (8 MHz)
- Low-speed on-chip oscillator (LOCO) (32.768 kHz)
- IWDG-dedicated on-chip oscillator (15 kHz)
- Clock trim function for HOCO/MOCO/LOCO
- Clock out support

■ General Purpose I/O Ports

- Up to 84 input/output pins
 - Up to 3 CMOS input
 - Up to 81 CMOS input/output
 - Up to 9 input/output 5-V tolerant
 - Up to 2 high current (20 mA)

■ Operating Voltage

- VCC: 1.6 to 5.5 V

■ Operating Temperature and Packages

- Ta = -40°C to +85°C
 - 100-pin LGA (7 mm × 7 mm, 0.65 mm pitch)
- Ta = -40°C to +105°C
 - 100-pin LQFP (14 mm × 14 mm, 0.5 mm pitch)
 - 64-pin LQFP (10 mm × 10 mm, 0.5 mm pitch)
 - 64-pin QFN (8 mm × 8 mm, 0.4 mm pitch)
 - 48-pin LQFP (7 mm × 7 mm, 0.5 mm pitch)
 - 48-pin QFN (7 mm × 7 mm, 0.5 mm pitch)
 - 40-pin QFN (6 mm × 6 mm, 0.5 mm pitch)

1. Overview

The MCU integrates multiple series of software- and pin-compatible Arm®-based 32-bit cores that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

The MCU provides an optimal combination of low-power, high-performance Arm Cortex®-M4 core running up to 48 MHz with the following features:

- 256-KB code flash memory
- 32-KB SRAM
- Segment LCD Controller (SLCDC)
- Capacitive Touch Sensing Unit (CTSU)
- USB 2.0 Full-Speed Module (USBFS)
- 14-bit A/D Converter (ADC14)
- 12-bit D/A Converter (DAC12)
- Security features.

| Code flash memory | Maximum 256-KB code flash memory. See section 44, Flash Memory in User's Manual. |
| Data flash memory | 8-KB data flash memory. See section 44, Flash Memory in User's Manual. |
| Option-setting memory | The option-setting memory determines the state of the MCU after a reset. See section 6, Option-Setting Memory in User's Manual. |
| SRAM | On-chip high-speed SRAM with either parity bit or Error Correction Code (ECC). An area in SRAM0 provides error correction capability using ECC. See section 43, SRAM in User's Manual. |

Table 1.3 System (1 of 2)

| Feature | Functional description |
|--|--|
| Operating modes | Two operating modes: <ul style="list-style-type: none"> • Single-chip mode • SCI/USB boot mode. See section 3, Operating Modes in User's Manual. |
| Resets | 14 resets: <ul style="list-style-type: none"> • RES pin reset • Power-on reset • VBATT-selected voltage power-on reset • Independent watchdog timer reset • Watchdog timer reset • Voltage monitor 0 reset • Voltage monitor 1 reset • Voltage monitor 2 reset • SRAM parity error reset • SRAM ECC error reset • Bus master MPU error reset • Bus slave MPU error reset • CPU stack pointer error reset • Software reset. See section 5, Resets in User's Manual. |
| Low Voltage Detection (LVD) | Low Voltage Detection (LVD) function monitors the voltage level input to the VCC pin, and the detection level can be selected using a software program. See section 7, Low Voltage Detection (LVD) in User's Manual. |
| Clocks | <ul style="list-style-type: none"> • Main clock oscillator (MOSC) • Sub-clock oscillator (SOSC) • High-speed on-chip oscillator (HOCO) • Middle-speed on-chip oscillator (MOCO) • Low-speed on-chip oscillator (LOCO) • PLL frequency synthesizer • IWDG-dedicated on-chip oscillator • Clock out support. See section 8, Clock Generation Circuit in User's Manual. |
| Clock Frequency Accuracy Measurement Circuit (CAC) | The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock to be used as a measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated. See section 9, Clock Frequency Accuracy Measurement Circuit (CAC) in User's Manual. |
| Interrupt Controller Unit (ICU) | The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC/DTC module and DMAC module. The ICU also controls NMI interrupts. See section 13, Interrupt Controller Unit (ICU) in User's Manual. |
| Key Interrupt Function (KINT) | A key interrupt can be generated by setting the Key Return Mode Register (KRM) and inputting a rising or falling edge to the key interrupt input pins. See section 20, Key Interrupt Function (KINT) in User's Manual. |
| Low power modes | Power consumption can be reduced in multiple ways, such as by setting clock dividers, stopping modules, selecting power control mode in normal operation, and transitioning to low power modes. See section 10, Low Power Modes in User's Manual. |
| Battery backup function | A battery backup function is provided for partial powering by a battery. The battery powered area includes RTC, SOSC, LOCO, wakeup control, backup memory, VBATT_R low voltage detection, and switches between VCC and VBATT. During normal operation, the battery powered area is powered by the main power supply, which is the VCC pin. When a VCC voltage drop is detected, the power source is switched to the dedicated battery backup power pin, the VBATT pin. When the voltage rises again, the power source is switched from the VBATT pin to the VCC pin. See section 11, Battery Backup Function in User's Manual. |
| Register write protection | The register write protection function protects important registers from being overwritten because of software errors. See section 12, Register Write Protection in User's Manual. |

Table 1.3 System (2 of 2)

| Feature | Functional description |
|-----------------------------------|--|
| Memory Protection Unit (MPU) | Four Memory Protection Units (MPUs) and a CPU stack pointer monitor function are provided for memory protection. See section 15, Memory Protection Unit (MPU) in User's Manual. |
| Watchdog Timer (WDT) | The Watchdog Timer (WDT) is a 14-bit down-counter. It can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, a non-maskable interrupt or interrupt can be generated by an underflow. A refresh-permitted period can be set to refresh the counter and used as the condition to detect when the system runs out of control. See section 25, Watchdog Timer (WDT) in User's Manual. |
| Independent Watchdog Timer (IWDT) | The Independent Watchdog Timer (IWDT) consists of a 14-bit down-counter that must be serviced periodically to prevent counter underflow. It can be used to reset the MCU or to generate a non-maskable interrupt/interrupt for a timer underflow. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically on a reset, underflow, refresh error, or by a refresh of the count value in the registers. See section 26, Independent Watchdog Timer (IWDT) in User's Manual. |

Table 1.4 Event link

| Feature | Functional description |
|-----------------------------|--|
| Event Link Controller (ELC) | The Event Link Controller (ELC) uses the interrupt requests generated by various peripheral modules as event signals to connect them to different modules, enabling direct interaction between the modules without CPU intervention. See section 18, Event Link Controller (ELC) in User's Manual. |

Table 1.5 Direct memory access

| Feature | Functional description |
|--------------------------------|--|
| Data Transfer Controller (DTC) | A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request. See section 17, Data Transfer Controller (DTC) in User's Manual. |
| DMA Controller (DMAC) | A 4-channel DMA Controller (DMAC) module is provided for transferring data without the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address. See section 16, DMA Controller (DMAC) in User's Manual. |

Table 1.6 Timers

| Feature | Functional description |
|--|---|
| General PWM Timer (GPT) | The General PWM Timer (GPT) is a 32-bit timer with 2 channels and a 16-bit timer with 6 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer. See section 22, General PWM Timer (GPT) in User's Manual. |
| Port Output Enable for GPT (POEG) | Use the Port Output Enable for GPT (POEG) function to place the General PWM Timer (GPT) output pins in the output disable state. See section 21, Port Output Enable for GPT (POEG) in User's Manual. |
| Low Power Asynchronous General Purpose Timer (AGT) | The Low Power Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting of external events. This 16-bit timer consists of a reload register and a down-counter. The reload register and the down-counter are allocated to the same address, and they can be accessed with the AGT register. See section 23, Low Power Asynchronous General Purpose Timer (AGT) in User's Manual. |
| Realtime Clock (RTC) | The Realtime Clock (RTC) has two counting modes, calendar count mode and binary count mode, that are controlled by the register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar. See section 24, Realtime Clock (RTC) in User's Manual. |

Table 1.7 Communication interfaces (1 of 2)

| Feature | Functional description |
|--|---|
| Serial Communications Interface (SCI) | The Serial Communications Interface (SCI) is configurable to five asynchronous and synchronous serial interfaces: <ul style="list-style-type: none"> Asynchronous interfaces (UART and asynchronous communications interface adapter (ACIA)) 8-bit clock synchronous interface Simple IIC (master-only) Simple SPI Smart card interface. The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. SCI0 and SCI1 have FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator. See section 28, Serial Communications Interface (SCI) in User's Manual. |
| I ² C Bus Interface (IIC) | The 3-channel I ² C Bus Interface (IIC) module conforms with and provides a subset of the NXP I ² C bus (Inter-Integrated Circuit bus) interface functions. See section 29, I ² C Bus Interface (IIC) in User's Manual. |
| Serial Peripheral Interface (SPI) | Two independent Serial Peripheral Interface (SPI) channels are capable of high-speed, full-duplex synchronous serial communications with multiple processors and peripheral devices. See section 31, Serial Peripheral Interface (SPI) in User's Manual. |
| Serial Sound Interface Enhanced (SSIE) | The Serial Sound Interface Enhanced (SSIE) peripheral provides functionality to interface with digital audio devices for transmitting PCM audio data over a serial bus with the MCU. The SSIE supports an audio clock frequency of up to 50 MHz, and can be operated as a slave or master receiver, transmitter, or transceiver to suit various applications. The SSIE includes 8-stage FIFO buffers in the receiver and transmitter, and supports interrupts and DMA-driven data reception and transmission. See section 33, Serial Sound Interface Enhanced (SSIE) in User's Manual. |
| Controller Area Network (CAN) module | The Controller Area Network (CAN) module provides functionality to receive and transmit data using a message-based protocol between multiple slaves and masters in electromagnetically noisy applications. The CAN module complies with the ISO 11898-1 (CAN 2.0A/CAN 2.0B) standard and supports up to 32 mailboxes, which can be configured for transmission or reception in normal mailbox and FIFO modes. Both standard (11-bit) and extended (29-bit) messaging formats are supported. See section 30, Controller Area Network (CAN) Module in User's Manual. |

Table 1.7 Communication interfaces (2 of 2)

| Feature | Functional description |
|-----------------------------------|--|
| USB 2.0 Full-Speed Module (USBFS) | The USB 2.0 Full-Speed Module (USBFS) can operate as a host controller or device controller. The module supports full-speed and low-speed (only for the host controller) transfer as defined in the Universal Serial Bus Specification 2.0. The module has an internal USB transceiver and supports all of the transfer types defined in the Universal Serial Bus Specification 2.0. The USB has buffer memory for data transfer, providing a maximum of 10 pipes. Pipes 1 to 9 can be assigned any endpoint number based on the peripheral devices used for communication or based on the user system. The MCU supports revision 1.2 of the Battery Charging specification. Because the MCU can be powered at 5 V, the USB LDO regulator provides the internal USB transceiver power supply at 3.3 V. See section 27, USB 2.0 Full-Speed Module (USBFS) in User's Manual. |

Table 1.8 Analog

| Feature | Functional description |
|---------------------------------------|--|
| 14-bit A/D Converter (ADC14) | A 14-bit successive approximation A/D converter is provided. Up to 25 analog input channels are selectable. Temperature sensor output and internal reference voltage are selectable for conversion. The A/D conversion accuracy is selectable from 12-bit and 14-bit conversion making it possible to optimize the tradeoff between speed and resolution in generating a digital value. See section 35, 14-Bit A/D Converter (ADC14) in User's Manual. |
| 12-Bit D/A Converter (DAC12) | The 12-Bit D/A Converter (DAC12) converts data and includes an output amplifier. See section 36, 12-Bit D/A Converter (DAC12) in User's Manual. |
| 8-Bit D/A Converter (DAC8) for ACMPLP | The 8-Bit D/A Converter (DAC8) converts data and does not include an output amplifier (DAC8). The DAC8 is used only as the reference voltage for ACMPLP. See section 40, 8-Bit D/A Converter (DAC8) in User's Manual. |
| Temperature Sensor (TSN) | The on-chip Temperature Sensor (TSN) determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is linear. The output voltage is provided to the ADC14 for conversion and can be further used by the end application. See section 37, Temperature Sensor (TSN) in User's Manual. |
| Low-Power Analog Comparator (ACMPLP) | The Low-Power Analog Comparator (ACMPLP) compares the reference input voltage and analog input voltage. The comparison result can be read through software and also be output externally. The reference voltage can be selected from an input to the CMPREFi(i = 0,1) pin, an internal 8-bit D/A converter output, or the internal reference voltage (Vref) generated internally in the MCU. The ACMPLP response speed can be set before starting an operation. Setting the high-speed mode decreases the response delay time, but increases current consumption. Setting the low-speed mode increases the response delay time, but decreases current consumption. See section 39, Low-Power Analog Comparator (ACMPLP) in User's Manual. |
| Operational Amplifier (OPAMP) | The Operational Amplifier (OPAMP) amplifies small analog input voltages and outputs the amplified voltages. A total of four differential operational amplifier units with two input pins and one output pin are provided. See section 38, Operational Amplifier (OPAMP) in User's Manual. |

| Feature | Functional description |
|--------------------------------------|--|
| Segment LCD Controller (SLCDC) | The Segment LCD Controller (SLCDC) provides the following functions: <ul style="list-style-type: none"> • Waveform A or B selectable • The LCD driver voltage generator can switch between an internal voltage boosting method, a capacitor split method, and an external resistance division method • Automatic output of segment and common signals based on automatic display data register read • The reference voltage generated when operating the voltage boost circuit can be selected in 16 steps (contrast adjustment) • The LCD can be made to blink. See section 45, Segment LCD Controller (SLCDC) in User's Manual. |
| Capacitive Touch Sensing Unit (CTSU) | The Capacitive Touch Sensing Unit (CTSU) measures the electrostatic capacitance of the touch sensor. Changes in the electrostatic capacitance are determined by software, which enables the CTSU to detect whether a finger is in contact with the touch sensor. The electrode surface of the touch sensor is usually enclosed within an electrical insulator so that fingers do not come into direct contact with the electrode. See section 41, Capacitive Touch Sensing Unit (CTSU) in User's Manual. |

Table 1.10 Data processing

| Feature | Functional description |
|--|---|
| Cyclic Redundancy Check (CRC) calculator | The Cyclic Redundancy Check (CRC) calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC generation polynomials are available. The snoop function allows monitoring reads from and writes to specific addresses. This function is useful in applications that require CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer. See section 32, Cyclic Redundancy Check (CRC) Calculator in User's Manual. |
| Data Operation Circuit (DOC) | The Data Operation Circuit (DOC) compares, adds, and subtracts 16-bit data. See section 42, Data Operation Circuit (DOC) in User's Manual. |

1.5 Pin Functions

Table 1.15 Pin functions (1 of 4)

| Function | Signal | I/O | Description |
|------------------------|--|--------|---|
| Power supply | VCC | Input | Power supply pin. Connect this pin to the system power supply. Connect it to VSS through a 0.1-μF capacitor. The capacitor should be placed close to the pin. |
| | VCL | I/O | Connect this pin to the VSS pin through the smoothing capacitor used to stabilize the internal power supply. Place the capacitor close to the pin. |
| | VSS | Input | Ground pin. Connect to the system power supply (0 V). |
| | VBATT | Input | Backup power supply pin |
| Clock | XTAL | Output | Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin. |

| | CLKOUT | Output | Clock output pin |
| Operating mode control | MD | Input | Pins for setting the operating mode. The signal levels on these pins must not be changed during operation mode transition on release from the reset state. |
| System control | RES | Input | Reset signal input pin. The MCU enters the reset state when this signal goes low. |
| CAC | CACREF | Input | Measurement reference clock input pin |
| Interrupt | NMI | Input | Non-maskable interrupt request pin |
| | IRQ0 to IRQ12, IRQ14, IRQ15 | Input | Maskable interrupt request pins |
| KINT | KR00 to KR07 | Input | Key interrupt input pins. A key interrupt (KINT) can be generated by inputting a falling edge to the key interrupt input pins. |
| On-chip debug | TMS | I/O | On-chip emulator or boundary scan pins |
| | TDI | Input | |
| | TCK | Input | |
| | TDO | Output | |
| | SWDIO | I/O | Serial wire debug data input/output pin |
| | SWCLK | Input | Serial wire clock pin |
| | SWO | Output | Serial wire trace output pin |
| Battery Backup | VBATWIO0 to VBATWIO2 | I/O | Output wakeup signal for the VBATT wakeup control function. External event input for the VBATT wakeup control function. |
| GPT | GTETRGA, GTETRGB | Input | External trigger input pin |
| | GTIOC0A to GTIOC7A, GTIOC0B to GTIOC7B | I/O | Input capture, output capture, or PWM output pin |
| | GTIU | Input | Hall sensor input pin U |
| | GTIV | Input | Hall sensor input pin V |
| | GTIW | Input | Hall sensor input pin W |
| | GTOUUP | Output | 3-phase PWM output for BLDC motor control (positive U phase) |
| | GTOULO | Output | 3-phase PWM output for BLDC motor control (negative U phase) |
| | GTOVUP | Output | 3-phase PWM output for BLDC motor control (positive V phase) |
| | GTOVLO | Output | 3-phase PWM output for BLDC motor control (negative V phase) |
| | GTOWUP | Output | 3-phase PWM output for BLDC motor control (positive W phase) |
| | GTOWLO | Output | 3-phase PWM output for BLDC motor control (negative W phase) |

Table 1.15 Pin functions (2 of 4)

| Function | Signal | I/O | Description |
|----------|--|--------|--|
| AGT | AGTEE0, AGTEE1 | Input | External event input enable signals |
| | AGTIO0, AGTIO1 | I/O | External event input and pulse output pins |
| | AGTO0, AGTO1 | Output | Pulse output pins |
| | AGTOA0, AGTOA1 | Output | Output compare match A output pins |
| | AGTOB0, AGTOB1 | Output | Output compare match B output pins |
| RTC | RTCOUT | Output | Output pin for 1-Hz/64-Hz clock |
| | RTCIC0 to RTCIC2 | Input | Time capture event input pins |
| SCI | SCK0 to SCK2, SCK9 | I/O | Clock (clock synchronous mode) input/output pins |
| | RXD0 to RXD2, RXD9 | Input | Received data (asynchronous mode/clock synchronous mode) input pins |
| | TXD0 to TXD2, TXD9 | Output | Transmitted data (asynchronous mode/clock synchronous mode) output pins |
| | CTS0_RTS0 to CTS2_RTS2, CTS9_RTS9 | I/O | Input/output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active-low |
| | SCL0 to SCL2, SCL9 | I/O | I ² C clock (simple IIC) input/output pins |
| | SDA0 to SDA2, SDA9 | I/O | I ² C data (simple IIC) input/output pins |
| | SCK0 to SCK2, SCK9 | I/O | Clock (simple SPI) input/output pins |
| | MISO0 to MISO2, MISO9 | I/O | Slave transmission of data (simple SPI) input/output pins |
| | MOSI0 to MOSI2, MOSI9 | I/O | Master transmission of data (simple SPI) input/output pins |
| IIC | SS0 to SS2, SS9 | Input | Slave-select input pins (simple SPI), active-low |
| | | | |
| SSIE | SCL0, SCL1 | I/O | Clock input/output pins |
| | SDA0, SDA1 | I/O | Data input/output pins |
| | SSIBCK0 | I/O | SSIE serial bit clock pin |
| | SSILRCK0/SSIFS0 | I/O | Word select pins |
| | SSITXD0 | Output | Serial data output pin |
| SPI | SSIRXD0 | Input | Serial data input pin |
| | AUDIO_CLK | Input | External clock pin for audio (input oversampling clock) |
| | RSPCKA, RSPCKB | I/O | Clock input/output pin |
| | MOSIA, MOSIB | I/O | Input/output pins for data output from the master |
| | MISOA, MISOB | I/O | Input/output pins for data output from the slave |
| CAN | SSLA0, SSLB0 | I/O | Input/output pins for slave selection |
| | SSLA1, SSLA2, SSLA3, SSLB1, SSLB2, SSLB3 | Output | Output pins for slave selection |
| | | | |
| CAN | CRX0 | Input | Receive data |
| | CTX0 | Output | Transmit data |

Table 1.15 Pin functions (3 of 4)

| Function | Signal | I/O | Description |
|---------------------|---|--------|---|
| USBFS | VSS_USB | Input | Ground pin |
| | VCC_USB_LDO | Input | Power supply pin for USB LDO regulator |
| | VCC_USB | I/O | Input: USB transceiver power supply pin. Output: USB LDO regulator output pin. This pin should be connected to an external capacitor. |
| | USB_DP | I/O | D+ I/O pin of the USB on-chip transceiver. This pin should be connected to the D+ pin of the USB bus. |
| | USB_DM | I/O | D- I/O pin of the USB on-chip transceiver. This pin should be connected to the D- pin of the USB bus. |
| | USB_VBUS | Input | USB cable connection monitor pin. This pin should be connected to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a device controller. |
| | USB_EXICEN | Output | Low power control signal for external power supply (OTG) chip |
| | USB_VBUSEN | Output | VBUS (5 V) supply enable signal for external power supply chip |
| | USB_OVRCURA, USB_OVRCURB | Input | Connect the external overcurrent detection signals to these pins. Connect the VBUS comparator signals to these pins when the OTG power supply chip is connected. |
| | USB_ID | Input | Connect the MicroAB connector ID input signal to this pin during operation in OTG mode |
| Analog power supply | AVCC0 | Input | Analog voltage supply pin |
| | AVSS0 | Input | Analog voltage supply ground pin |
| | VREFH0 | Input | Analog reference voltage supply pin |
| | VREFL0 | Input | Reference power supply ground pin |
| | VREFH | Input | Analog reference voltage supply pin for D/A converter |
| | VREFL | Input | Analog reference ground pin for D/A converter |
| ADC14 | AN000 to AN014, AN016 to AN025 | Input | Input pins for the analog signals to be processed by the A/D converter |
| | ADTRG0 | Input | Input pins for the external trigger signals that start the A/D conversion, active-low |
| DAC12 | DA0 | Output | Output pins for the analog signals to be processed by the D/A converter |
| Comparator output | VCOUT | Output | Comparator output pin |
| ACMPLP | CMPREF0, CMPREF1 | Input | Reference voltage input pin |
| | CMPIN0, CMPIN1 | Input | Analog voltage input pins |
| OPAMP | AMP0+ to AMP3+ | Input | Analog voltage input pins |
| | AMP0- to AMP3- | Input | Analog voltage input pins |
| | AMP0O to AMP3O | Output | Analog voltage output pins |
| CTSU | TS00 to TS13, TS17 to TS22, TS27 to TS31, TS34, TS35 | Input | Capacitive touch detection pins (touch pins) |
| | TSCAP | - | Secondary power supply pin for the touch driver |

2. Electrical Characteristics

Unless otherwise specified, the electrical characteristics of the MCU are defined under the following conditions:

$VCC^{*1} = AVCC0 = VCC_USB^{*2} = VCC_USB_LDO^{*2} = 1.6$ to $5.5V$, $VREFH = VREFH0 = 1.6$ to $AVCC0$, $VBATT = 1.6$ to $3.6V$, $VSS = AVSS0 = VREFL = VREFL0 = VSS_USB = 0V$, $T_a = T_{opr}$

Note 1. The typical condition is set to $VCC = 3.3V$.

Note 2. When USBFS is not used.

Figure 2.1 shows the timing conditions.

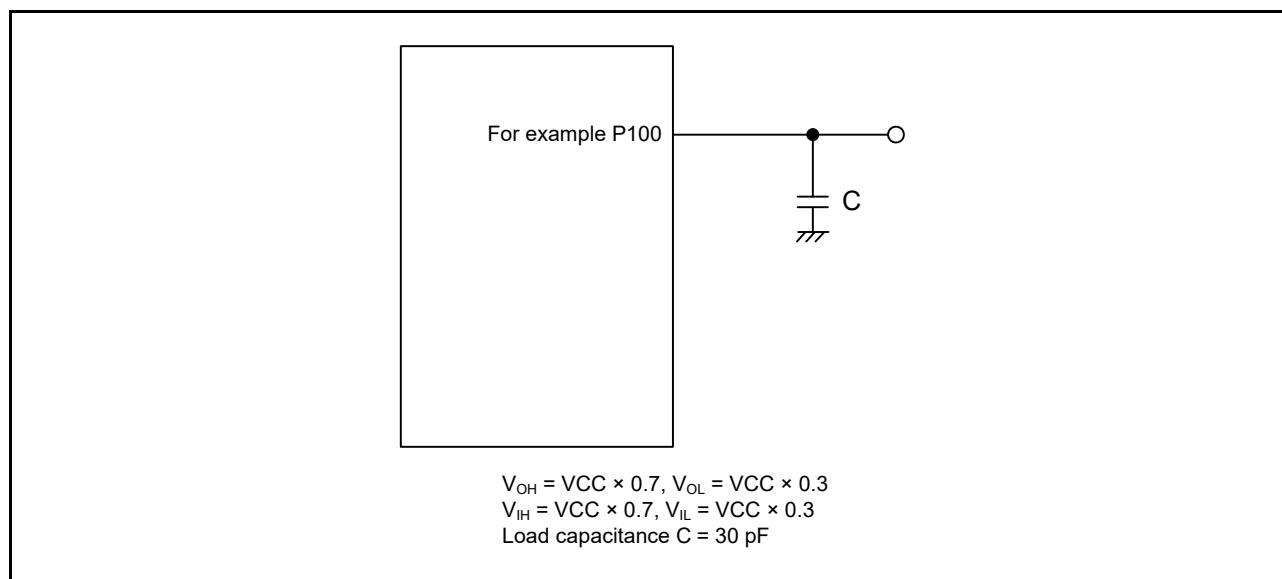

Figure 2.1 Input or output timing measurement conditions

The recommended measurement conditions for the timing specification of each peripheral provided are for the best peripheral operation. Make sure to adjust the driving abilities of each pin to meet your conditions.

Each function pin used for the same function must select the same drive ability. If the I/O drive ability of each function pin is mixed, the AC specification of each function is not guaranteed.

2.1 Absolute Maximum Ratings

Table 2.1 Absolute maximum ratings

| Parameter | | Symbol | Value | Unit |
|--------------------------------|------------------------------|------------------|---------------------|------|
| Power supply voltage | | VCC | -0.5 to +6.5 | V |
| Input voltage | 5 V-tolerant ports*1 | V _{in} | -0.3 to +6.5 | V |
| | P000 to P008, P010 to P015 | V _{in} | -0.3 to AVCC0 + 0.3 | V |
| | Others | V _{in} | -0.3 to VCC + 0.3 | V |

| LCD voltage | VL1 voltage | V _{L1} | -0.3 to +2.8 | V |
| | VL2 voltage | V _{L2} | -0.3 to +6.5 | V |
| | VL3 voltage | V _{L3} | -0.3 to +6.5 | V |
| | VL4 voltage | V _{L4} | -0.3 to +6.5 | V |
| Operating temperature*2,*3,*4 | | T _{opr} | -40 to +105 | °C |
| | | | -40 to +85 | |
| Storage temperature | | T _{stg} | -55 to +125 | °C |

Caution: Permanent damage to the MCU may result if absolute maximum ratings are exceeded.

To preclude any malfunctions due to noise interference, insert capacitors of high frequency characteristics between the VCC and VSS pins, between the AVCC0 and AVSS0 pins, between the VCC_USB and VSS_USB pins, between the VREFH0 and VREFL0 pins, and between the VREFH and VREFL pins. Place capacitors of about 0.1 μF as close as possible to every power supply pin and use the shortest and heaviest possible traces. Also, connect capacitors as stabilization capacitance.

Connect the VCL pin to a VSS pin by a 4.7 μF capacitor. The capacitor must be placed close to the pin.

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up might cause malfunction and the abnormal current that passes in the device at this time might cause degradation of internal elements.

Note 1. Ports P205, P206, P400 to P404, P407, P408 are 5 V tolerant.

Note 2. See [section 2.2.1, Tj/Ta Definition](#).

Note 3. Contact a Renesas Electronics sales office for information on derating operation under T_a = +85°C to +105°C. Derating is the systematic reduction of load for improved reliability.

Note 4. The upper limit of operating temperature is +85°C or +105°C, depending on the product. For details, see [section 1.3, Part Numbering](#).

| | VREFH | When used as DAC12 Reference | 1.6 | - | AVCC0 | V |
| | VREFL | | - | 0 | - | V |

Note 1. Use AVCC0 and VCC under the following conditions:

AVCC0 and VCC can be set individually within the operating range when $VCC \geq 2.2\text{ V}$ and $AVCC0 \geq 2.2\text{ V}$.

$AVCC0 = VCC$ when $VCC < 2.2\text{ V}$ or $AVCC0 < 2.2\text{ V}$.

Note 2. When powering on the VCC and AVCC0 pins, power them on at the same time, or power the VCC pin first and then the AVCC0 pin.

2.2 DC Characteristics

2.2.1 T_j/T_a Definition

Table 2.3 DC Characteristics

Conditions: Products with operating temperature (T_a) -40 to +105°C

| Parameter | Symbol | Typ | Max | Unit | Test conditions |
|----------------------------------|----------------|-----|-------|------|---|
| Permissible junction temperature | T _j | - | 125 | °C | High-speed mode Middle-speed mode Low-voltage mode Low-speed mode Subosc-speed mode |
| | | | 105*1 | | |

Note: Make sure that $T_j = T_a + \theta_{ja} \times \text{total power consumption (W)}$,
where total power consumption = $(V_{CC} - V_{OH}) \times \Sigma I_{OH} + V_{OL} \times \Sigma I_{OL} + I_{CCmax} \times V_{CC}$.

Note 1. The upper limit of operating temperature is +85°C or +105°C, depending on the product. For details, see [section 1.3, Part Numbering](#). If the part number shows the operation temperature at 85°C, then the maximum value of T_j is +105°C, otherwise, it is +125°C.

Table 2.16 Rising and falling gradient and ripple frequency characteristics

Conditions: VCC = AVCC0 = VCC_USB = 1.6 to 5.5 V

The ripple voltage must meet the allowable ripple frequency $f_r(VCC)$ within the range between the VCC upper limit (5.5 V) and lower limit (1.6 V).

When VCC change exceeds VCC $\pm 10\%$, the allowable voltage change rising/falling gradient $dt/dVCC$ must be met.

Note 1. Time until the clock can be used after the Main Clock Oscillator Stop bit (MOSCCR.MOSTP) is set to 0 (operating) when the external clock is stable.

Note 2. The VCC range that the PLL can be used is 2.4 to 5.5 V.

Note 3. After changing the setting of the SOSCCR.SOSTP bit so that the sub-clock oscillator operates, only start using the sub-clock after the sub-clock oscillation stabilization wait time elapses, that is greater than or equal to the value recommended by the oscillator manufacturer.

Note 4. The 48-MHz HOCO can be used within a VCC range of 1.8 V to 5.5 V.

Note 5. The 64-MHz HOCO can be used within a VCC range of 2.4 V to 5.5 V.

Note 6. This is a characteristic when HOCOCR.HCSTP bit is set to 0 (oscillation) in MOCO stop state.

When HOCOCR.HCSTP bit is set to 0 (oscillation) during MOCO oscillation, this specification is shortened by 1 μs.

Note 7. Whether stabilization time has elapsed can be confirmed by OSCSF.HOCOSF.

Note 8. This is a characteristic when PLLCR.PLLSTP bit is set to 0 (operation) in MOCO stop state.

When PLLCR.PLLSTP bit is set to 0 (operation) during MOCO oscillation, this specification is shortened by 1 μs.

Note 9. When setting up the main clock, ask the oscillator manufacturer for an oscillation evaluation and use the results as the recommended oscillation stabilization time. Set the MOSCWTCR register to a value equal to or greater than the recommended stabilization time. After changing the setting of the MOSCCR.MOSTP bit so that the main clock oscillator operates, read the OSCSF.MOSCSF flag to confirm that it is 1, then start using the main clock.

Note 3. This is a parameter for ADC14 when the internal reference voltage is used as the high-potential reference voltage.

Note 4. This is a parameter for ADC14 when the internal reference voltage is selected for an analog input channel in ADC14.

Figure 2.70 Illustration of 14-bit A/D converter characteristic terms

Absolute accuracy

Absolute accuracy is the difference between output code based on the theoretical A/D conversion characteristics, and the actual A/D conversion result. When measuring absolute accuracy, the voltage at the midpoint of the width of analog input voltage (1-LSB width), which can meet the expectation of outputting an equal code based on the theoretical A/D conversion characteristics, is used as the analog input voltage. For example, if 12-bit resolution is used and the reference voltage $V_{REFH0} = 3.072$ V, then 1-LSB width becomes 0.75 mV, and 0 mV, 0.75 mV, and 1.5 mV are used as the analog input voltages. If analog input voltage is 6 mV, an absolute accuracy of ± 5 LSB means that the actual A/D conversion result is in the range of 003h to 00Dh, though an output code of 008h can be expected from the theoretical A/D conversion characteristics.

Integral nonlinearity error (INL)

Integral nonlinearity error is the maximum deviation between the ideal line when the measured offset and full-scale errors are zeroed, and the actual output code.

Differential nonlinearity error (DNL)

Differential nonlinearity error is the difference between 1-LSB width based on the ideal A/D conversion characteristics and the width of the actually output code.

Offset error

Offset error is the difference between the transition point of the ideal first output code and the actual first output code.

Full-scale error

Full-scale error is the difference between the transition point of the ideal last output code and the actual last output code.

Figure 2.71 Illustration of D/A converter characteristic terms

Integral nonlinearity error (INL)

Integral nonlinearity error is the maximum deviation between the ideal output voltage based on the ideal conversion characteristic when the measured offset and full-scale errors are zeroed, and the actual output voltage.

Differential nonlinearity error (DNL)

Differential nonlinearity error is the difference between 1-LSB voltage width based on the ideal D/A conversion characteristics and the width of the actual output voltage.

Offset error

Offset error is the difference between the highest actual output voltage that falls below the lower output limit and the ideal output voltage based on the input code.

Full-scale error

Full-scale error is the difference between the lowest actual output voltage that exceeds the upper output limit and the ideal output voltage based on the input code.

| Data hold time | After 1000 times of N _{PEC} | t _{DRP} | 20*2, *3 | - | - | Year | T _a = +85°C |

Note 1. The reprogram/erase cycle is the number of erasures for each block. When the reprogram/erase cycle is n times (n = 1,000), erasing can be done n times for each block. For instance, when 8-byte programming is performed 256 times for different addresses in 2-KB blocks, and then the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address for several times as one erasure is not enabled (overwriting is prohibited).

Note 2. Characteristic when using the flash memory programmer and the self-programming library provided by Renesas Electronics.

Note 3. This result is obtained from reliability testing.

Note 1. The reprogram/erase cycle is the number of erasure for each block. When the reprogram/erase cycle is n times (n = 100,000), erasing can be performed n times for each block. For instance, when 1-byte programming is performed 1,000 times for different addresses in 1-byte blocks, and then the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address for several times as one erasure is not enabled. Overwriting is prohibited.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.

7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
